Building Management Systems

Our *Pro-active* approach to Building Management Systems ensures consistent, reliable operation of your installation. Advanced software techniques allow identification and rectification of problems before anyone even notices.

Any System, Anywhere

Broad experience with a wide range of different vendor's equipment means that regardless of the system you have, our techniques can be applied to successfully improve your site.

Remote management techniques allow for instant response to problems, troubleshooting, and ad-hoc requests, no matter where your equipment is located. Faults can be automatically reported by our software to mobile phones or pagers within moments, allowing you to respond to unforeseen events before even the most troublesome occupants have a chance to complain.

Experienced with Your Environment

We have experience in a wide range of applications, including Commercial Office Space, Industrial Manufacturing Areas, Research & Development Laboratories, Animal Breeding facilities, high-rise Hotel Apartments, Clubs, and large Retail Shopping Centres.

Our services cover troubleshooting, maintenance agreements, integration with corporate networks, system expansion, upgrades, and new installations. By filtering out complexities we can provide simple, intuitive interfaces which supply relevant information to meet your specific management requirements.

Multi-Vendor Compatibility

Having worked with systems from large BMS vendors to those using PLCs or even hardwired logic, as well as numerous graphical front end software packages, we can release you from the pain of being tied to a single source for your needs.
