Software Development

We provide complete solutions to business problems, using whatever technology is suitable for your specific application. Our implementations consider all aspects of your business, and other process changes necessary to make your investment a success.

Business Problems – Solved!

Rather than focussing on any one particular programming language, we provide complete solutions to business problems, using whatever technologies are most applicable. We also consider other important aspects of any technology project, including the business process change and human resource implications.

Our software has been deployed in a wide range of applications, including Industrial Manufacturing Areas, Research & Development Laboratories, as well as in countless 'standard' commercial business applications.

Using the most appropriate language…

We have experience with numerous software development environments, including Visual Basic, Java, C, C++, Assembly, Macromedia Flash™, ASP, PHP, JavaScript, VBScript, MySQL, Access, SQL Server, Lotus Notes & Domino, as well as a large number of others. Our services include design, development, implementation, maintenance agreements, integration with corporate networks, system expansion, upgrades, and new installations.

We have also integrated software solutions across many platforms, such as PLC to Corporate Management System interfaces, and SAP data analysis. See our service summary document for further details on our full range of offerings.

Instant Response

Remote management techniques allow for instant response to problems, troubleshooting, and ad-hoc requests, no matter where your equipment is located.
